

GEKO Lined Standard ASME Ball Valves

GKV225A

Lining virgin PFA

One-piece ball/stem design,
 Al_2O_3 ball option

Maintenance-free stem seal

Low torque, high flow rate

Lined Standard ASME/ANSI Ball Valves

Fields of application

The design of the ball valves series GKV225 is based on more than 30

years of application experience with lined ball valves. They provide an excellent ratio of economic and operational performance in a wide variety of process applications.

The Richter ball valves are designed

- as shut-off and automated valves for corrosive and hazardous media,
- where stainless steel, special metals, PVDF etc. are not sufficiently corrosion-resistant,
- as alternative to valves made of exotic special metals and
- serve as reliable alternative to lined plug valves due to higher flow rates, much lower torques and minimum maintenance.

Product features

- PFA-lined one-piece ball/stem unit, optional Al_2O_3 ceramic ball
- Full ports of GKV225 sizes 1" and 2" to ASME/ANSI result in high flow rates, minimum pressure losses and a more efficient piping system.
- GKV225 sizes 3", 4" and 6" to ASME/ANSI with reduced port feature a compact design with smaller valve body envelope and lowest possible torque for economic actuation.
- Locking devices
- Gear operators on request

Type code

	manual actuation	remote actuation
• ASME/ANSI ball valve	GKV225/...	GKV225P/
• Lining PFA fluoroplastic	.../F	...

Efficient alternative to plug valves

- Plug valves provide some $\frac{2}{3}$ of full port ball valve flow only, whereas full port ball valves allow for downsizing of pipeline system by at least 1 size. Reduced port ball valves provide flows equal to plug valves.
- Plug valves require 100-350 % more torque, therefore in most cases larger actuator needed.
- The plug is seated in the body lining instead of seat rings. Wear and tear requires body or complete valve ("throw away valve") to be exchanged. No ceramic option.
- Plug valves have conventional packing-type stem sealing, not self-adjusting, not maintenance-free.
- Cavity volume underneath plug
- Plug core usually made of ductile iron unlike ball valves with SS ball core

Reliable body and seat sealing

- ① 3 mm ($\frac{1}{8}$ ") thick virgin PFA body lining
 - High permeation resistance
 - Vacuum-proof anchored
 - Translucent, optimum quality assurance
- ② Pressure-bearing body made of ductile cast iron EN-JS 1049 (0.7043)/ASTM A395, absorbs system and pipe forces.
- ③ Permanent body flange sealing
 - Effective even under the most frequent thermal cycle conditions
 - Sealing zone (3a) with full lining thickness
 - Labyrinth-like sealing (3b) maximizes surface pressure.
 - Body pieces position themselves properly by means of the cup and cone shapes (3c) of each piece. Metal centering (3d) with-stands lateral and angular pipe forces.
 - Almost metal-to-metal flange contact (3e) in the circumference area controls the effects of temperature variations.

- ④ One-piece ball/stem design
 - Stainless steel core
 - Eliminates individual plastic lined mating parts for higher pressure/temperature ratings and optimises operational safety.
 - Al_2O_3 (99,7 %) ceramic ball option
- ⑤ Energised PTFE seat rings provide a permanent spring load onto the ball and ensure of gas-tight sealing.
- ⑥ Time-tested maintenance-free stem seal
 - Outstanding long-life seal performance
 - Gas-tight to EN 12266, leakage rate A
 - Spring gland follower ensures of tightness even with changing conditions.
 - Visual inspection of sealing load
 - Manually adjustable from outside
- ⑦ Universal ISO 5211 mounting dimensions
- ⑧ External corrosion protection

Body epoxy coated. Packing gland, lever, lever stop, nuts and bolts stainless steel. Optional ASTM A193/B7M bolting.

Innovative cone shape stem seal design

The PTFE packing insert translates a low axial thrust into a higher radial sealing force by means of the law of cone. The packing gland is designed with a diameter as small as possible. The result: outstanding stem seal performance under the most challenging conditions, permanent preload controlled manual adjustability at any time.

An added benefit is the ability to monitor the live loaded condition of the stem seal simply by inspecting the "gap" between the packing followers, thus lending this design to the user's preventive maintenance program.

Stem seal design

Pressure/temperature range

Body EN-JS1049 (0.7043)/PFA:

-60 °C (-75 °F) to +200 °C (400 °F);

max. 16 bar (235 psi) acc. to AD 2000

Body ASTM A395/PFA:

-29 °C (-20 °F) to +200 °C (400 °F);

max. 17.2 bar (250 psi) acc. to ASME B16.42

For low temperature applications observe local rules!
